Technical Manager · What we will build — Slide 10

Thank you. I'm [Name], the Technical Manager.

Think of a traffic light that knows the road is empty and turns green for you. That's the kind of city we're building.

We will install sensors that measure traffic, energy and water, smart cameras that help keep our streets safe, and smart traffic lights. We will use solar panels that give us clean energy and lower bills, and connect everything through one control center and a city app.

Each one solves a real problem: less traffic, safer streets, and lower bills.

The smart meters show families how much energy and water they use, so they can save more.

➡️ **So, how does it all work together?**

Technical Manager · How it all connects — Slide 11

It works in four steps: sensors collect the data, the network sends it, the control center decides, and citizens see the result in the app.

The control center is the brain of the city: all the data comes to one place.

And from the app, citizens can pay bills and renew documents from their phone.

For example, if there is an accident, the cameras see it, and the control center sends help faster.

And every step is protected by cybersecurity, so citizens' data stays safe.

So: the road is empty, the light turns green, and Ahmed gets home sooner.

➡️ **But to build all this, we need the right resources.**

We need five types: people, around 186 in the infrastructure phase, materials like cables, equipment like cameras, money, and time.

Our people include engineers, technicians, software and cybersecurity experts, and contractor crews who build in the streets.

Most of these people work in Phase 4, when we build the network and install the devices.

Our equipment also includes smart meters, servers, and field vehicles.

Some of this we already have, like cameras and fiber. The rest, we buy through our partners.

➡️ Now, let's talk about the budget. Our Finance Manager, [Name], will tell you.
