

Thank you. I'm Rahma, the Technical Manager.

So now, think of a traffic light that knows the road is empty and turns green for you. That's the kind of city we're building.

To build this city, we will install sensors that measure traffic, energy and water, smart cameras that help keep our streets safe, and smart traffic lights. We will also use solar panels that give us clean energy and lower bills, and then connect everything through one control center and a city app.

➡️ **So, how does it all work together?**

Well, it works in four steps: first, sensors collect the data; then, the network sends it to the control center; after that, the control center analyzes the information and makes decisions; and finally, citizens see the result in the app.

In other words, the control center is the brain of the city.

And from the app, citizens can pay bills and renew documents from their phone.

For example, if there is an accident, the cameras see it, and the control center sends help faster.

So: when the road is empty, the system detects it, sends the information, and changes the traffic light to green.

The result? Less waiting, less traffic, and more time for everyone!

➡️ **But to build all this, we need the right resources.**

So now, let's look at our resources. We need five types.

First, people: around 186 in the infrastructure phase. They include engineers, technicians, software and cybersecurity experts.

Second, materials, like cables.

Third, equipment, like cameras, smart meters, and servers.

And finally, money and time.

➡️ **Now, let's talk about the budget. Our Finance Manager, Moaz, will tell you.**
