

Thank you. I'm [Name], the Technical Manager.

So now, think of a traffic light that knows the road is empty and turns green for you. That's the kind of city we're building.

To build this city, we will install sensors that measure traffic, energy and water, smart cameras that help keep our streets safe, and smart traffic lights. We will also use solar panels that give us clean energy and lower bills, and then connect everything through one control center and a city app.

➡️ **So, how does it all work together?**

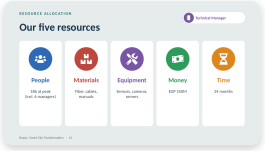

Well, it works in four steps: first, sensors collect the data; then, the network sends it; after that, the control center decides; and finally, citizens see the result in the app.

In other words, the control center is the brain of the city: all the data comes to one place.

And from the app, citizens can pay bills and renew documents from their phone.

So, for example: the road is empty, the light turns green, and Ahmed gets home sooner.

➡️ **But to build all this, we need the right resources.**

So now, let's look at our resources. We need five types: people, around 186 in the infrastructure phase, materials like cables, equipment like cameras, money, and time.

The good news is, some of this we already have, like cameras and fiber. And the rest, we buy through our partners.

➡️ **Now, let's talk about the budget. Our Finance Manager, [Name], will tell you.**
